

ABSTRACT

A method for presenting an aggregate view of native resources includes the step of enumerating a plurality of system-scoped native resources provided by a system scope. A plurality of application-scoped native resources provided by an application isolation scope are enumerated, some of which correspond to some of the plurality of system-scoped resources. For one of the plurality of system-scoped resources, the existence of a corresponding one of the plurality of application-scoped resources is determined and the corresponding one of the plurality of application-scoped resources is included in an aggregate view of native resources.
